---

The hide function was introduced by the developers to help farmers reach crops that may be hidden by trees or buildings. When you click on a tree (or any other item like buildings) you will receive an option to "Hide" that tree. When you activate the option the tree will temporarily disappear from your screen, leaving behind a red square where the tree normally sits. To clear this you need to reload your farm page and the tree will be back in its old position. This option is not available to people harvesting your trees - the developers are looking at a way to introduce this at a later stage.
